

# An Evaluation of the Impact of Automated Programming Hints on Performance and Learning

Samiha Marwan  
[samarwan@ncsu.edu](mailto:samarwan@ncsu.edu)

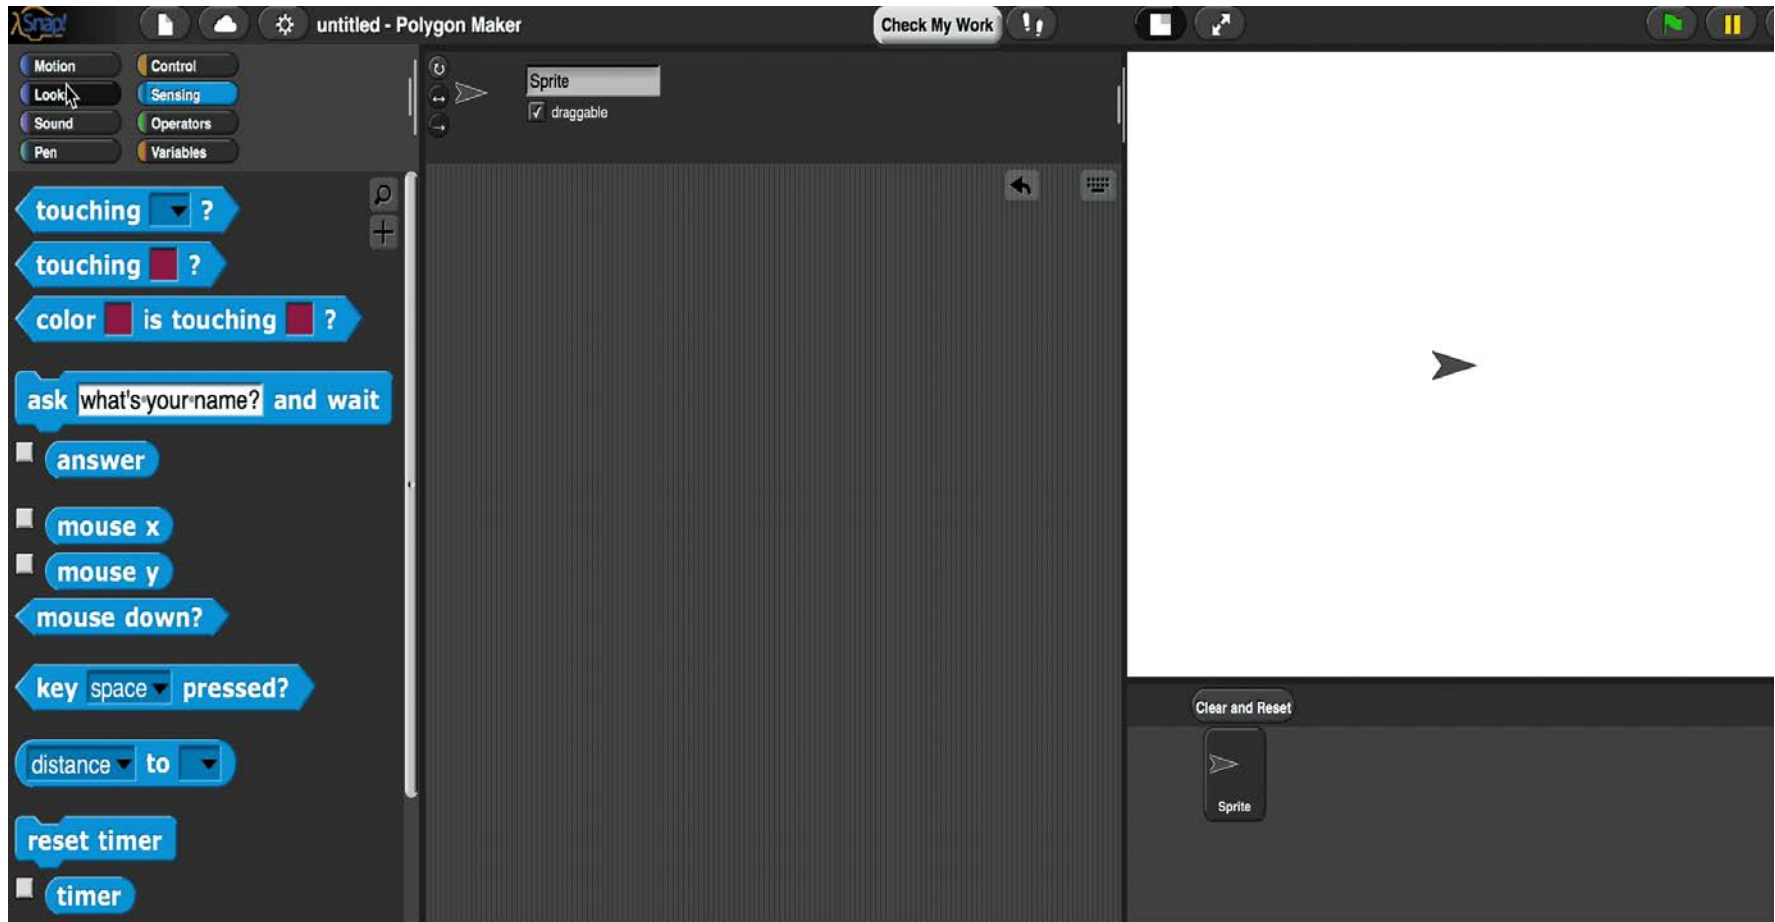

Dr. Joseph Williams  
[williams@cs.toronto.edu](mailto:williams@cs.toronto.edu)

Dr. Thomas Price  
[twprice@ncsu.edu](mailto:twprice@ncsu.edu)

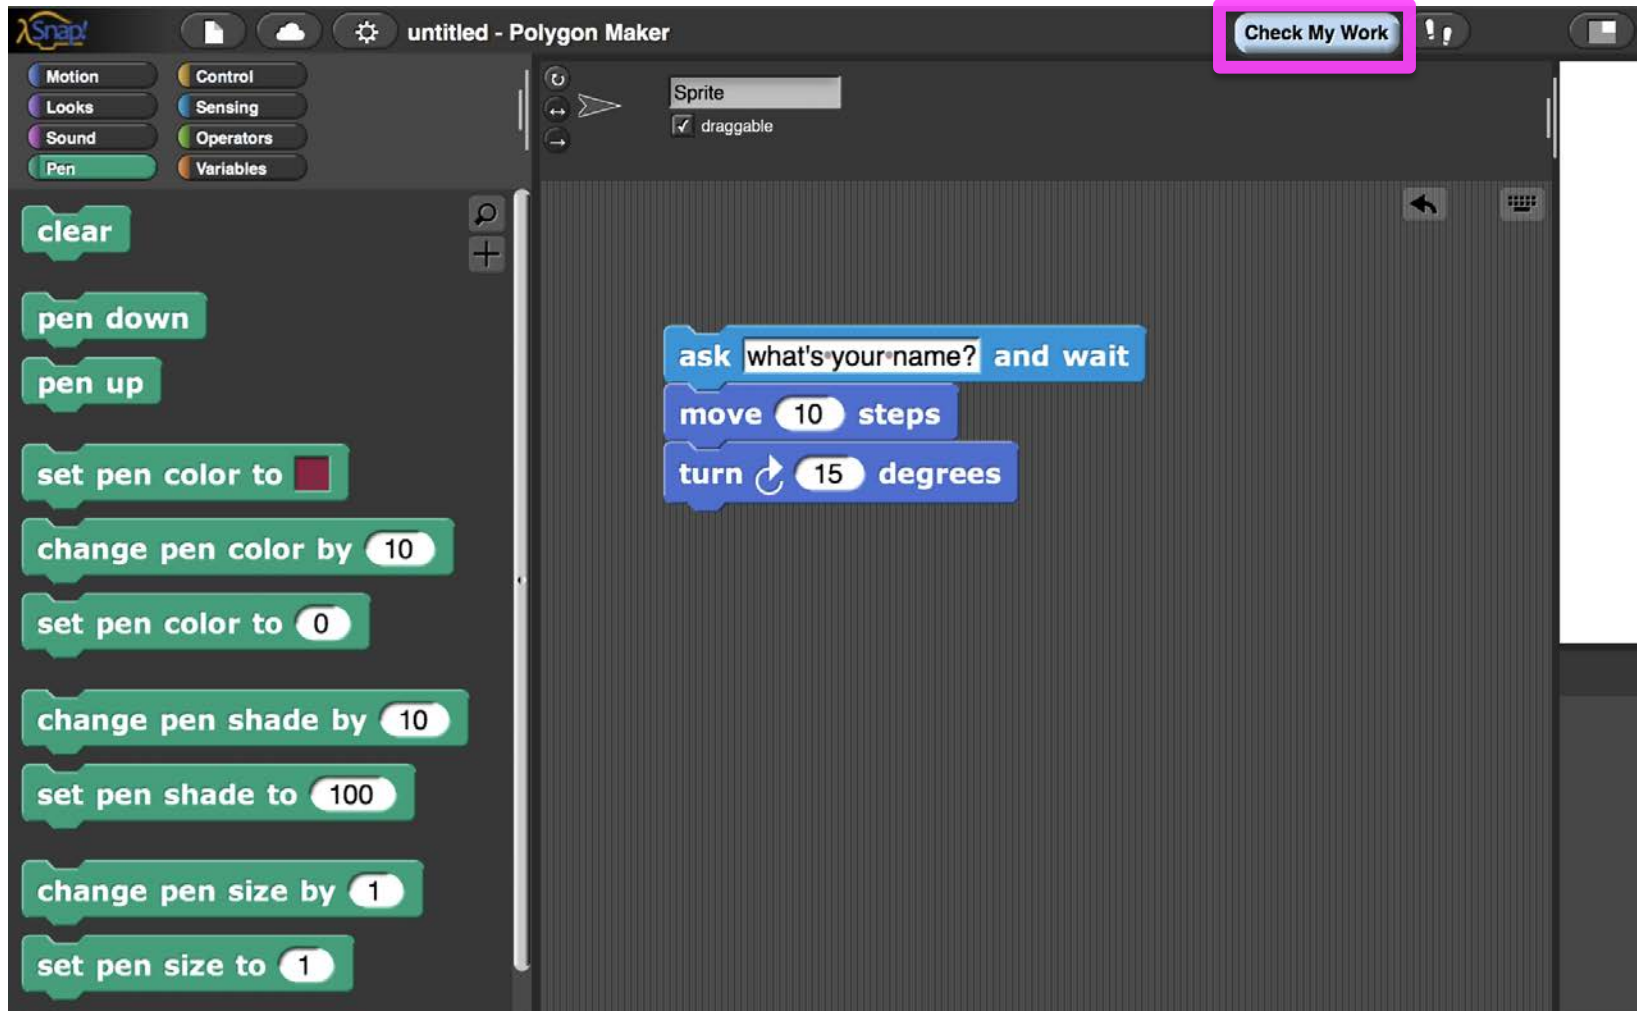

- Imagine Jill (a student) working on his first programming homework on Snap.
- Jill feels **stuck**.
- It is **Midnight** ..

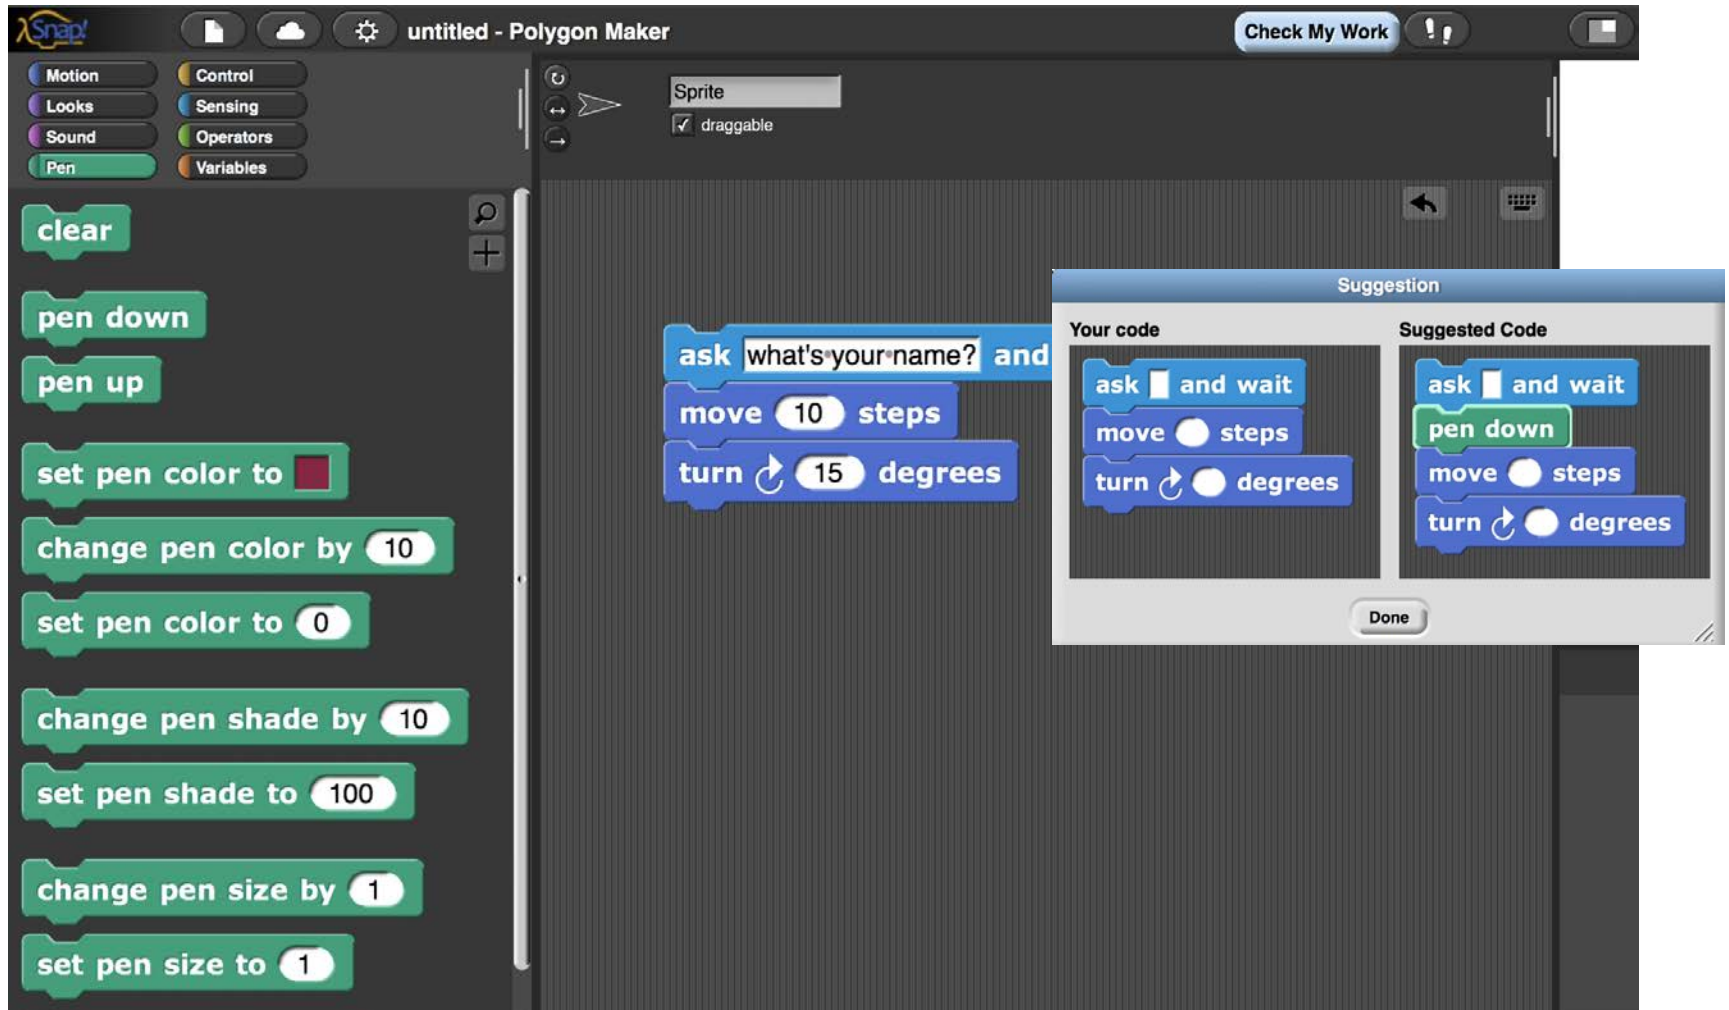

- One way to help Jill is to allow the programming environment to provide him with **automated hints**.
- Why automated hints?
  - Adaptive to students' code.
  - Can scale to new problems and contexts.
    - (**Price et al., 2017, Rivers et al., 2017**)
  - Can improve students' performance and learning.
    - (**Corbett et al., 2001, Fossati et al., 2015**)

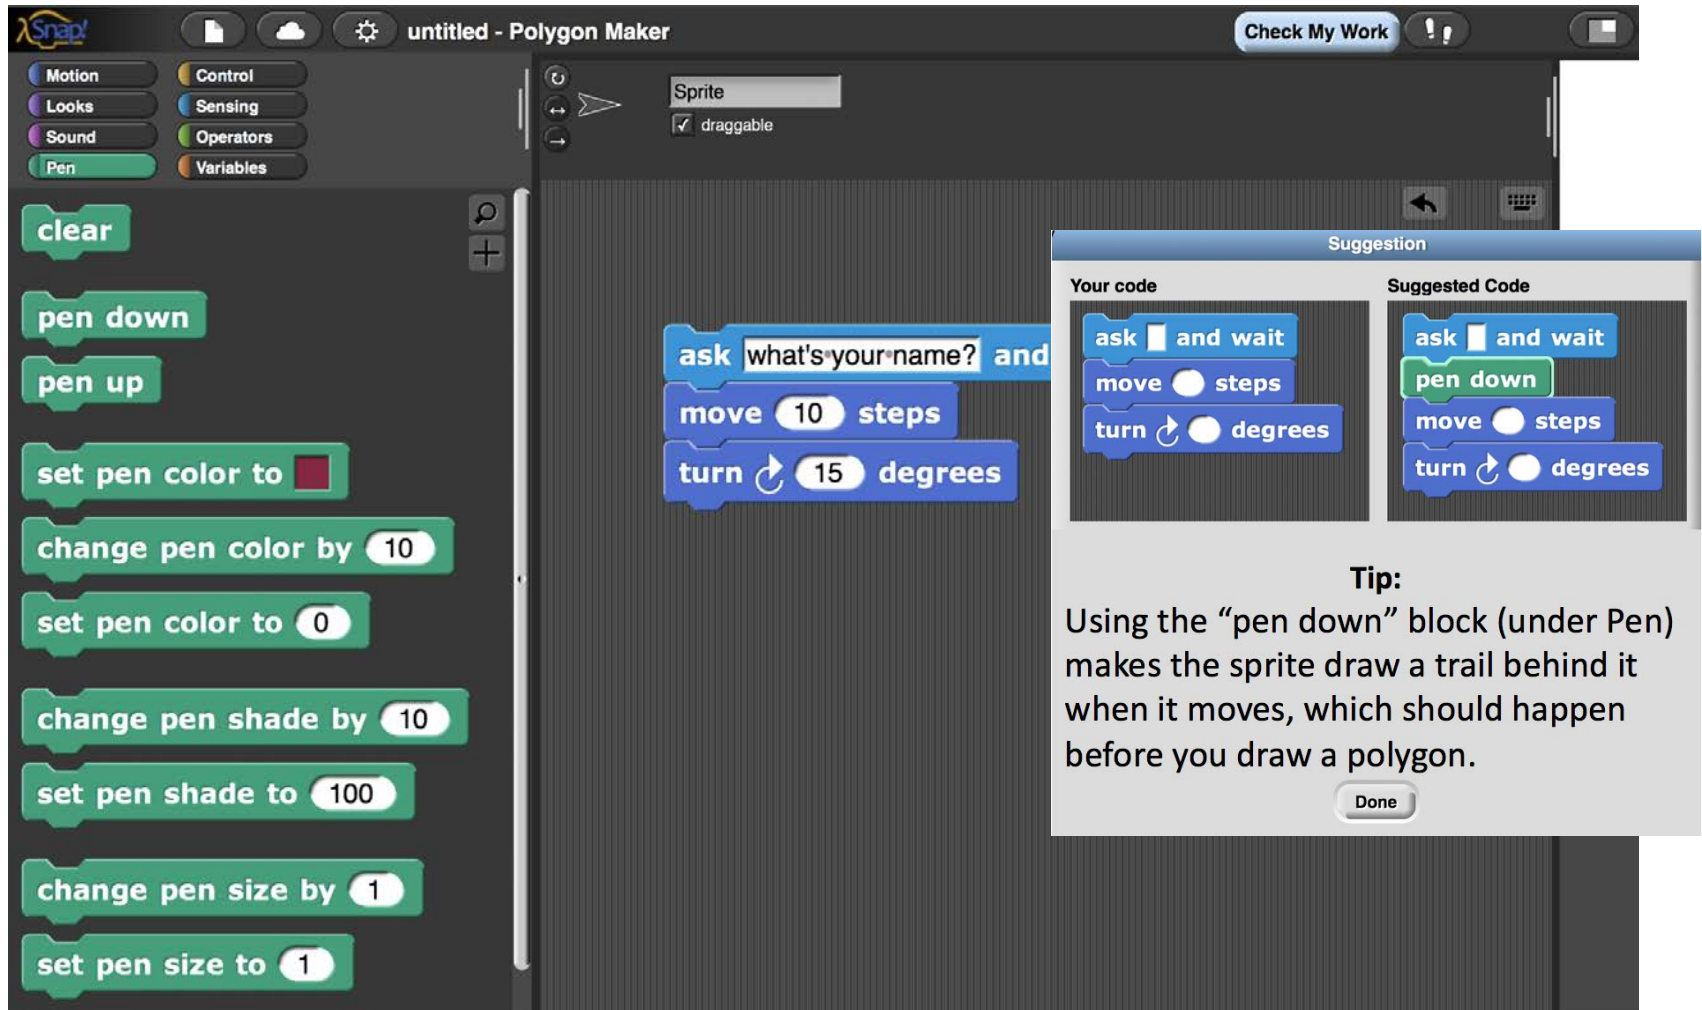

- Jill can ask for a hint from iSnap (**Price et al., 2017**)
  - But there are many design choices to consider....

- Should the hint show Jill *only the next step to do*? (eg. Rivers et al., 2017, Watson et al., 2012)

- Should the hint give some *text explaining why and how* Jill needs to do this step? (e.g. Marwan et al., 2019)

- Should the hint ask Jill to *self-explain* the hint ? (e.g. Vihavainen et al., 2015)

The screenshot shows the Snap! Polygon Maker interface. The left sidebar contains categories: Motion, Looks, Sound, Pen, Control, Sensing, Operators, and Variables. The main workspace shows a sprite with the following code blocks:

- clear
- pen down
- pen up
- set pen color to [red]
- change pen color by 10
- set pen color to 0
- change pen shade by 10
- set pen shade to 100
- change pen size by 1
- set pen size to 1

The right sidebar shows the 'Sprite' section with a 'draggable' checkbox. The 'Suggestion' panel on the right displays a comparison between 'Your code' and 'Suggested Code'.

Your code	Suggested Code
ask [ ] and wait	ask [ ] and wait
move [ ] steps	pen down
turn [ ] degrees	move [ ] steps
	turn [ ] degrees

**Tip:**  
Using the “pen down” block (under Pen) makes the sprite draw a trail behind it when it moves, which should happen before you draw a polygon.

**Why do you think Snap recommended this hint?**

.....

Done

# Motivation

- While there is some evidence that programming hints can be helpful, there are many open questions:
  - How and when is each type of hint useful?
  - Do automated hints only get students ‘unstuck’? Or can they lead to learning as well?
  - Automated hints only show *what* to do – is this sufficient, or do we need human-authored explanations?
  - What are students’ perceptions on each hint design?

# Primary Contributions

- Additional features to next-step code hints: *textual explanations*, and *self-explanation prompts*.
- Study 1:
  - Students' perspectives on the value of code hints with different features.
- Study 2:
  - Impact of code hints with additional features on students' behavior (e.g. performance, and learning).

# Overview

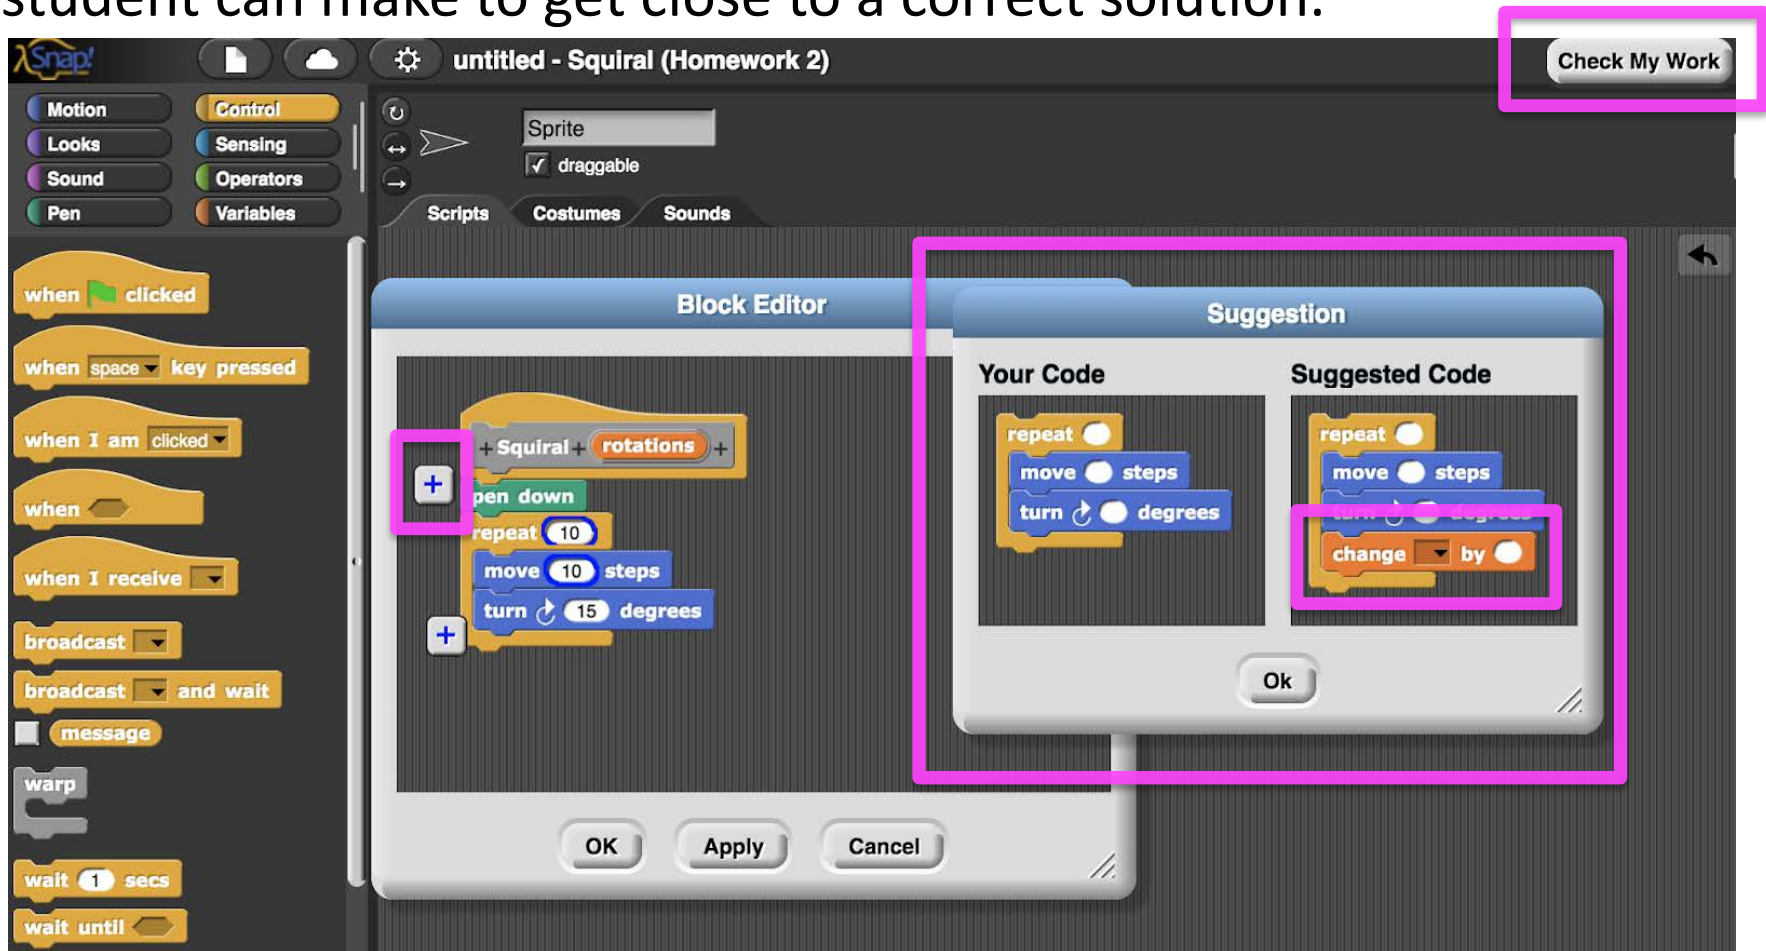

- Hints Design
- Study 1
- Study 2
- Discussion
- Future Work

How do we design effective hints for programming?

# DESIGN OF HINTS

# Hint Design: Code Hints

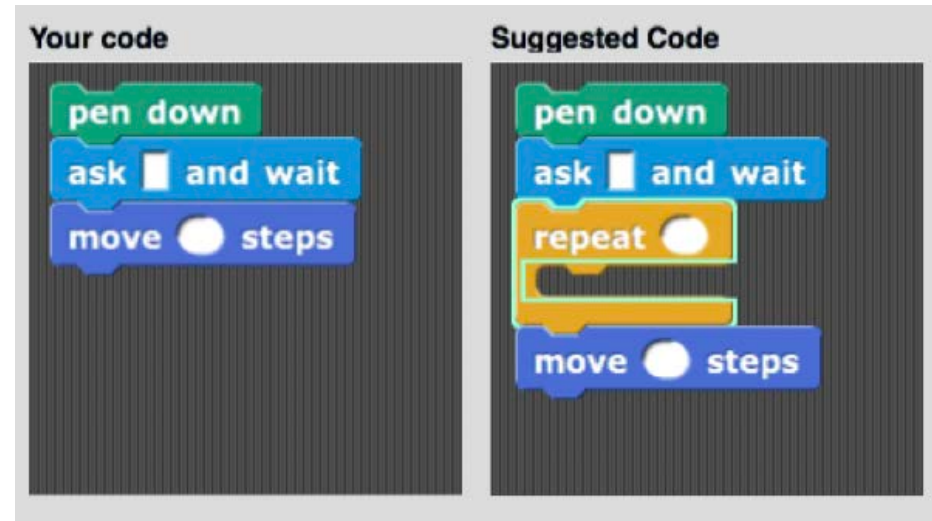

iSnap already provides *Code hints* that suggest an **edit** the student can make to get close to a correct solution.

# Limitation #1: Lack of Explanations

**Code hints** say **what to do**, but they do not say **why**.

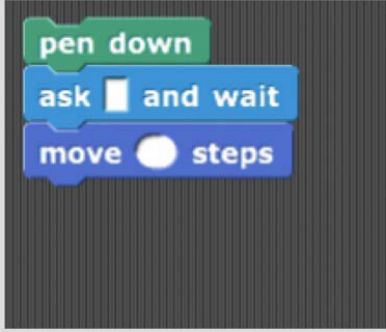

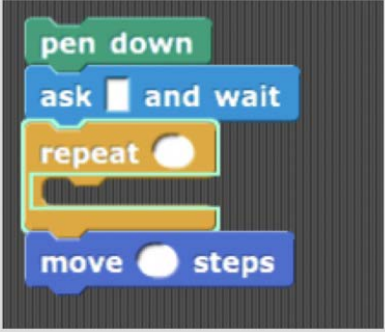

- This makes hints difficult to interpret (Price et al., 2017, Gusukuma et al., 2018).

# Solution: Add Textual Explanations

- To address this, in our prior work, we studied adding textual explanations to code hints (Marwan et al., 2019).
- Results:**
  - Learners rate hints as more useful, and interpretable, compared to code hints only.
  - However, we did not find evidence that these hints improve learners' performance

### Suggestion

Your code	Suggested Code
	

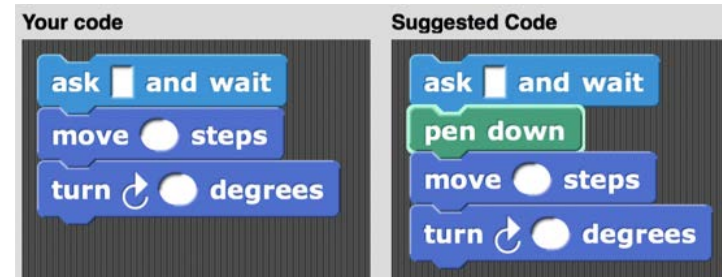

**Tip:**

The repeat block under “Control” allows you to run the same code a fixed number of times, like moving and turning the sprite to draw each side of a polygon.

Done

## Limitation #2: Bottom-out Hints

**Code hints** are “bottom-out” hints that give away part of the solution

- Leads to learning **only** when students spontaneously self-explain the hint (Aleven et al., 2016, Shih et al., 2008).
- Self-explanations of examples can benefit learning (Williams et al., 2016, McNamara et al., 2017).
  - However, they may frustrate learners (Shin et al., 2018).
- Fewer studies have explored self-explanation prompts in programming (Vihavainen et al., 2015, Vieira et al., 2017).

# Solution: Self-Explanation Prompts

**Explore:** the effect of adding self-explanations to hints in iSnap.

**Your code**

**Suggested Code**

**Text Hint:**

The "repeat" block (under Control) allows you to run the same code a fixed number of times, like moving and turning the sprite to draw each side of a polygon.

**Why do you think Snap recommended this hint?**

to reduce commands and draw the polygon

## Self-Explanation Prompt:

Require students to reason about the information they have received.

What are students' perceptions on each hint design?

# STUDY 1

# Study 1

## Goal:

- Understand *students' subjective perceptions* of code hints, textual explanations and self-explanation prompts
  - Specifically: *when* and *how* they are helpful, and *how they can be improved*.

# Study 1

## Population:

- 10 Undergraduate students, who have attested to have no prior programming experience.
  - Limitation: all *males*; ages (18-20)

## Procedure:

- 1-on-1 user-study.

Step 1	iSnap tutorial	5-10 min
Step 2	Task 1	15-20 min
Step 3	Interview 1	5-10 min
Step 4	Task 2	15-20 min
Step 5	Interview 2	8-12 min

# Programming Tasks

- Draw a regular polygon with any number of sides.

```
pen down
ask How many sides? and wait
repeat answer
  move 40 steps
  turn 360 / answer degrees
pen up
```

- Draw a series of triangles.

```
pen down
ask How many triangles? and wait
repeat answer
  repeat 3
    move 40 steps
    turn 120 degrees
  move 40 steps
pen up
```

# Study 1

## Procedure:

*For both tasks, students received all types of hints randomly:*

### All Conditions: Code Hints

**Your code**

**Suggested Code**

**Text Hint:**

The "repeat" block (under Control) allows you to run the same code a fixed number of times, like moving and turning the sprite to draw each side of a polygon.

**Why do you think Snap recommended this hint?**

to reduce commands and draw the polygon

# Study 1

# Study 1

## Data:

- Complete traces of students' work.
- Audio-recordings of students' interviews

## *Qualitative Analysis*

- All 10 students responses were analyzed by:
  - Identifying and grouping both **positive** and **negative** themes that emerged for each type of hint and how they can be improved.

# Study 1

## Code hints:

- Helped students to see a clear next action they could take.

P10

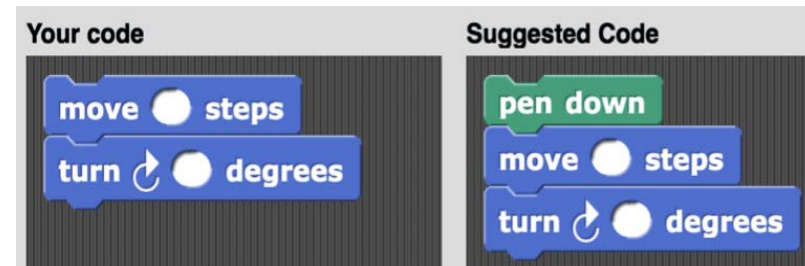

*"it showed you your code next to what you should do"*

- Specifically useful for students who are using iSnap for the first time.

P6

*"it gives you something that you had not thought about."*

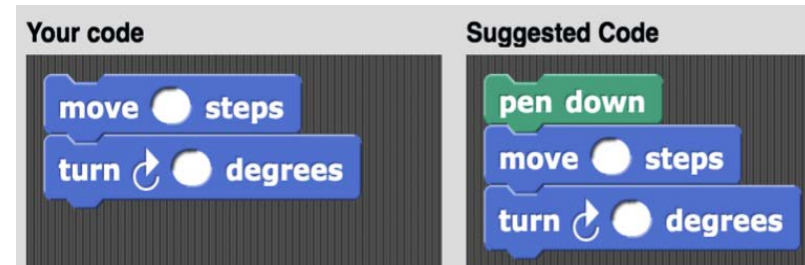

# Study 1

## Code hints:

- *However*, Code Hints only said what to do, but not why

P3

*"it just told me what to do but I did not know what the problem is or how can I fix it up"*

P9

*"code hint itself cannot provide enough information"*

# Study 1

## Code hints with Textual Explanations:

- Gave useful but different information from a code hint.

*"[the code hint] shows which block to use and the text gives an idea of what to use it for."*

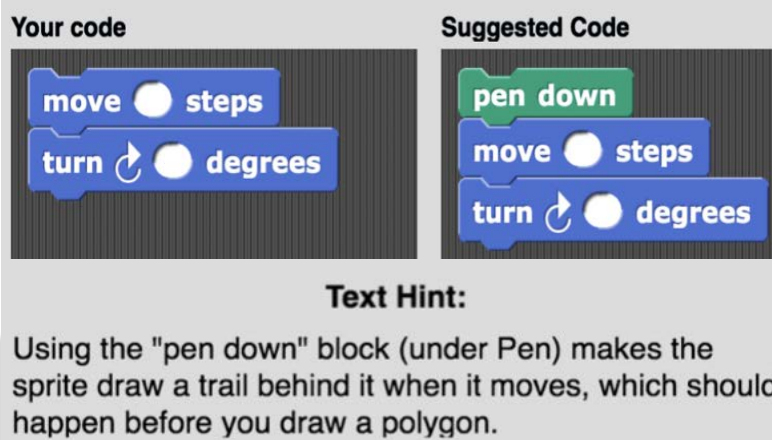

P6

- *No downside* for the student (easy enough to ignore)

*"[Adding text hints to code hints] can not be not helpful."*

P9

**Your code**

- move steps
- turn degrees

**Suggested Code**

- pen down
- move steps
- turn degrees

**Text Hint:**

Using the "pen down" block (under Pen) makes the sprite draw a trail behind it when it moves, which should happen before you draw a polygon.

# Study 1

## Self Explanation Prompts with Hints:

- Help students stop and think more deeply about the hint.

P8

*“it made me think and take a step back about the whole process.”*

- *However*, they can be frustrating and confusing.

P5

*“it is not giving me anything back, it is just asking me if I understood it.”*

**Your code**

**Suggested Code**

**Text Hint:**  
Using the "pen down" block (under Pen) makes the sprite draw a trail behind it when it moves, which should happen before you draw a polygon.

**What is this hint trying to help you to understand or do?**

# Study 1

## *Our results suggested that:*

- Students see the benefits in all three types of hint support, which offer complementary benefits.
- *However*, some students did find self-explanation prompts to be confusing or irritating.
- Therefore, it is important to investigate how they impact students' outcomes.

What is the effect of hints on learners' performance and learning?

# STUDY 2

# Study 2

## Goal:

- Investigate the effect of hints on *performance* and *learning* in a *larger-scale study*.

## Research Questions:

What is the effect of hints *with and without* self-explanation prompts on:

- learners' *performance*?
- their *learning* (performance on future tasks without hints)?
- their *hint usage* during programming?

## Study 2

### Population:

- 201 total crowd workers through Amazon's Mechanical Turk (MTurk) platform.
  - Have no prior programming experience.

An effective form of conducting large-scale user studies in lieu of using university participants (Behrend et al., 2011, and Kittur et al., 2008)

- Demographically similar in age and education level (84.5% B.S. degree).

## Study 2

### Procedure:

- Similar to study 1 (iSnap tutorial, task 1, task 2), **except:**

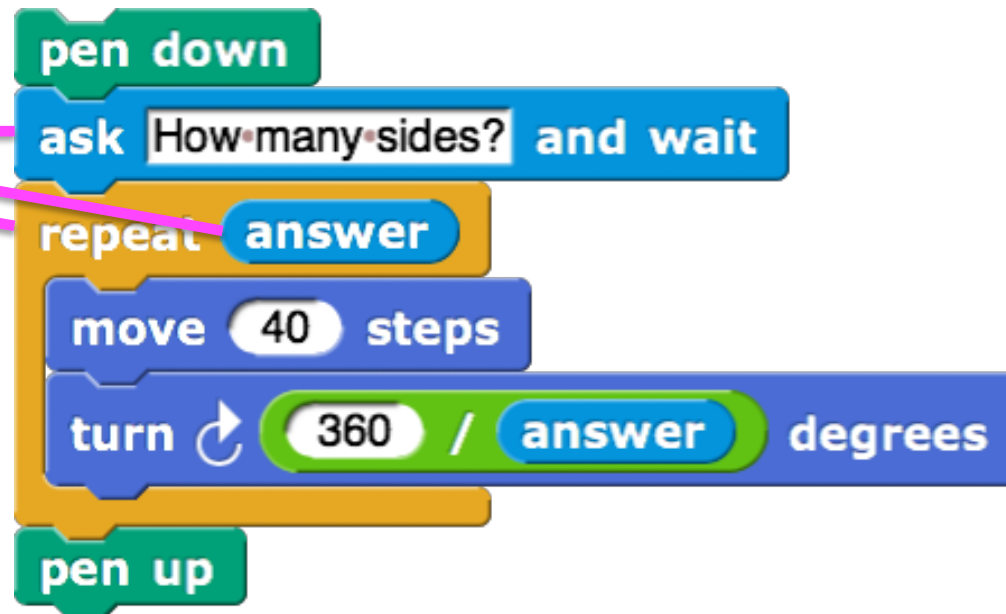

<p>1- Each learner is assigned to one condition:</p> <ul style="list-style-type: none"><li>• <b>CT:</b> Code + text</li><li>• <b>CTE:</b> Code + Text + Prompt</li><li>• <b>Control:</b> No Hint</li></ul>	<p>2- Task 2 was used as a post-test:</p> <ul style="list-style-type: none"><li>• No hints were given to all groups.</li><li>• Used to assess learning</li></ul>
<p>3- Study 2 was online study, <i>without interviews</i></p>	<p>4- Both Tasks were only for 15 min.</p>

# Study 2

## Measures:

- Performance:
  - Each task is divided into 4 objectives

Ask for sides, and  
repeat answer  
times

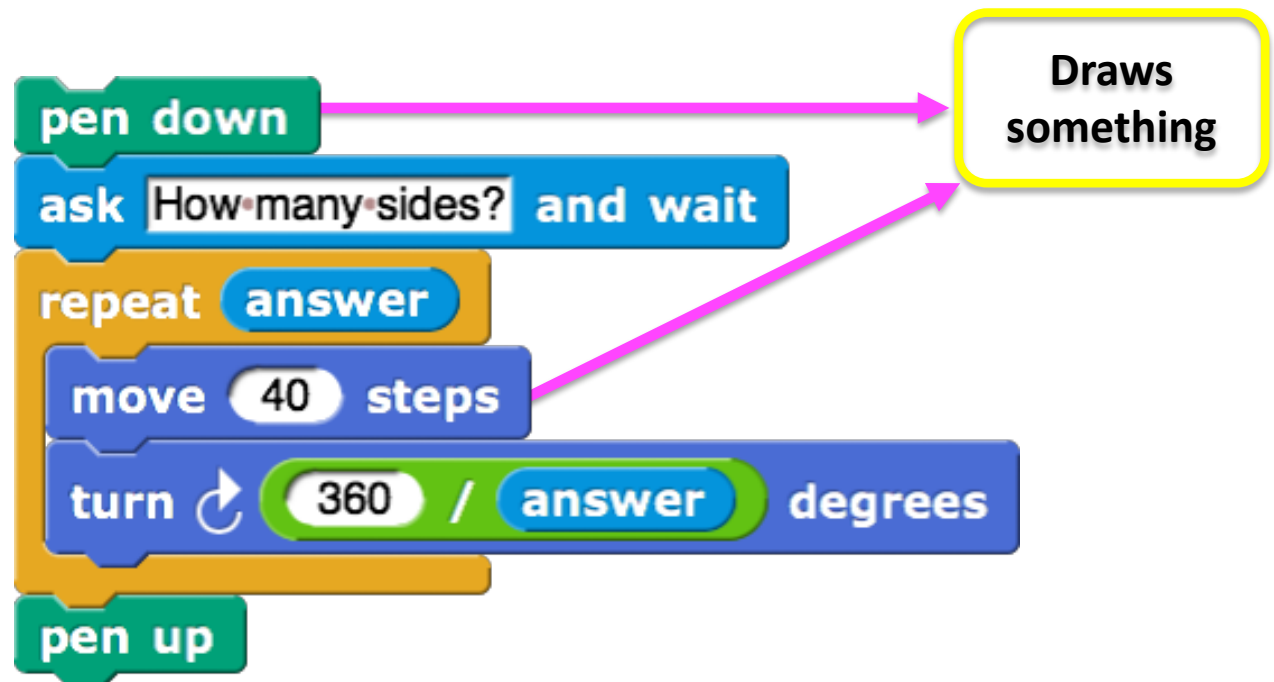

# Study 2

## Measures:

- Performance:
  - Each task is divided into 4 objectives

# Study 2

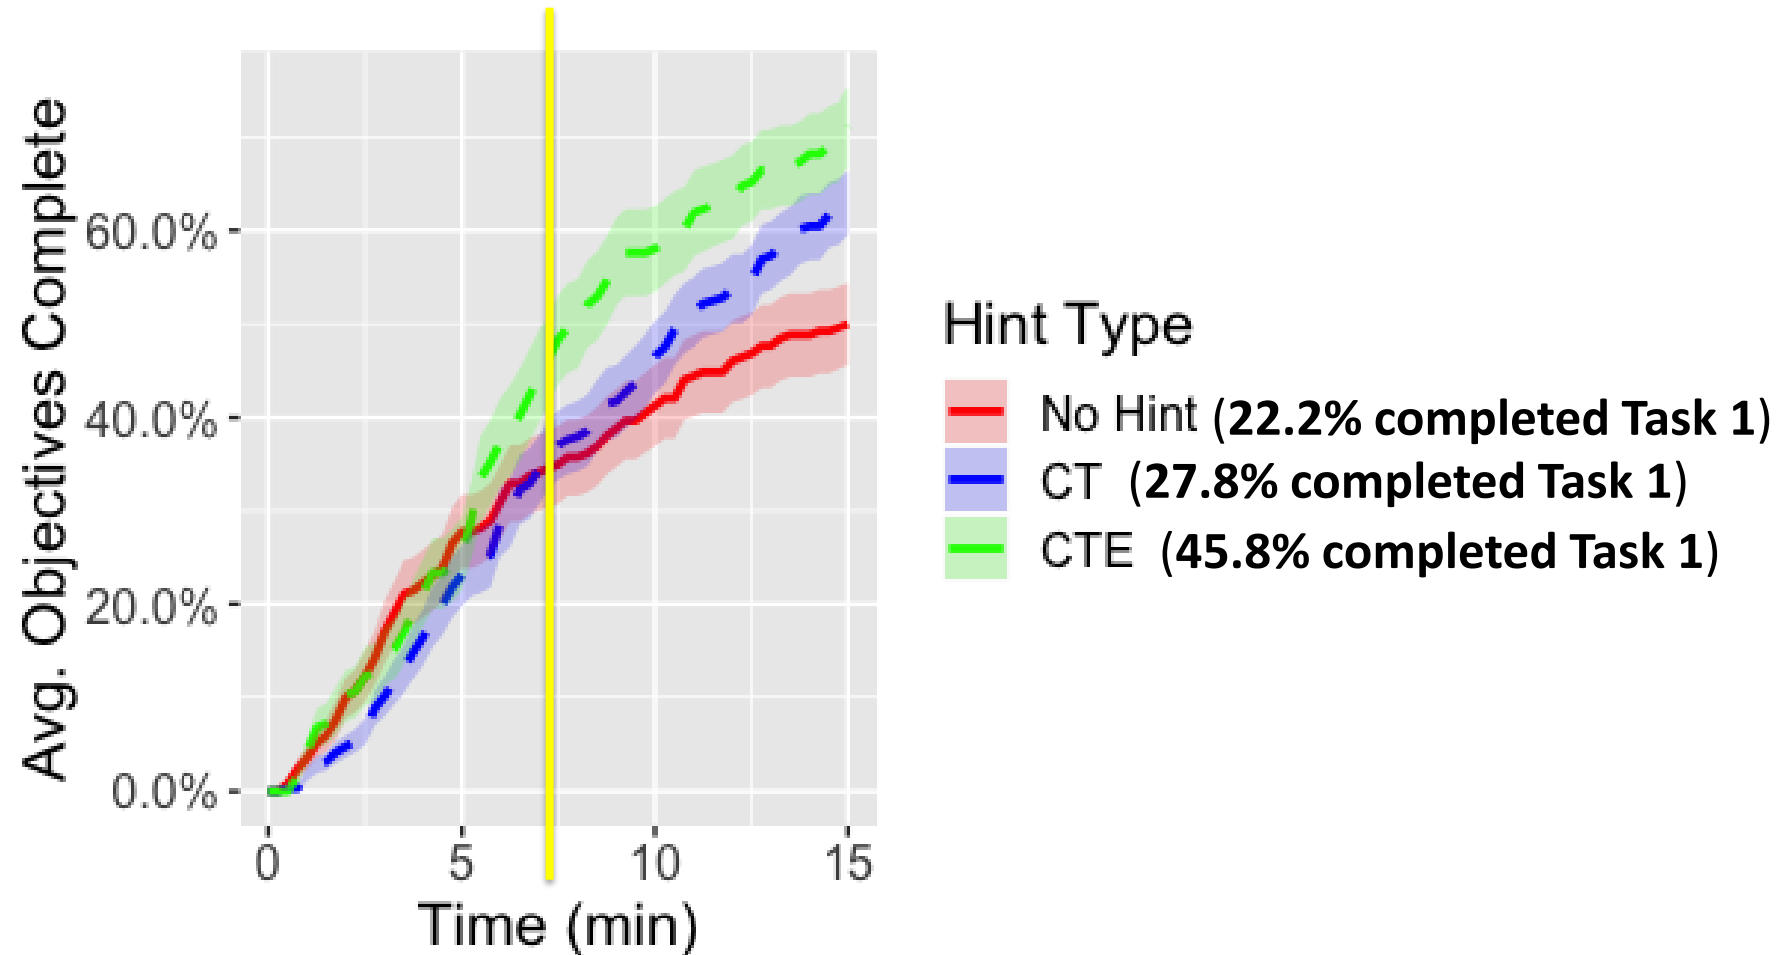

## Measures:

- Performance:
  - developed an automatic grader to determine the number of objectives completed by each learner.
  - analyzed time taken to complete each objective.

# Study 2

**RQ1:** What is the impact of hints on learners' *performance*?

## Study 2

**RQ1:** What is the impact of hints on learners' *performance*?

	Control	CT	CTE
Mean	2	2.53	2.8
SD	1.40	1.24	1.31
P-value	0.001		

Kruskal-Wallis test

Both conditions with code hints *completed significantly more objectives* than the control condition.

- Dunn's test with Benjamini-Hochberg correction for multiple comparisons:
  - Control group and CT learners ( $p = 0.045$ )
  - Control group and CTE learners ( $p = 0.001$ )
  - CT and CTE learners ( $p = 0.104$ ).

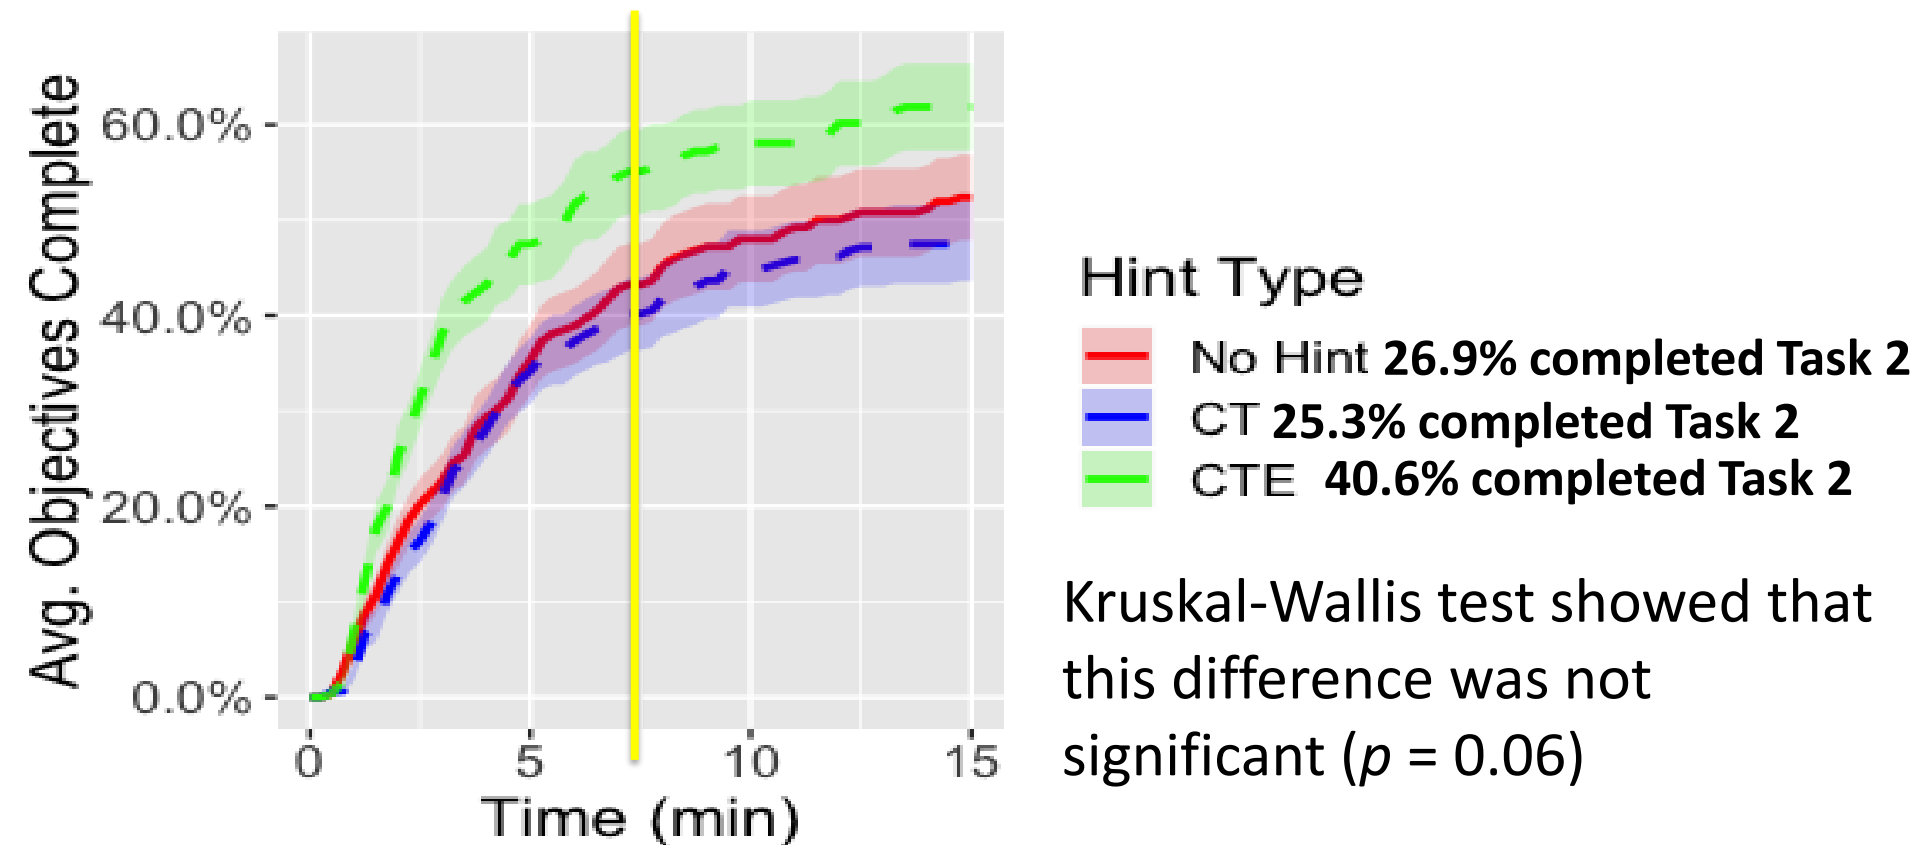

# Study 2

## Measures:

- Learning:
  - Task 2 served as our measure of learning
    - *No hints on this task.*
  - Consists of 4 objectives.
    - First two objectives *were identical* to the first two objectives in Task 1
      - Measure how well participants *learned to repeat these steps in a new context.*
    - Last two objectives *were different*
      - measured learners' ability to *apply the same programming constructs in a new way* (e.g. *use of nested loops*).

# Study 2

**RQ2:** What is the impact of hints on learners' *learning*?

## Study 2

**RQ2:** What is the impact of hints on learners' *learning*?

- Performance on the first two objectives on Task 2 (*isomorphic to Task 1*):
  - A Kruskal-Wallis test shows a significant difference across groups ( $p = 0.013$ ).
  - A post-hoc Dunn's test with Benjamini-Hochberg correction for multiple comparisons:
    - CTE learners and the Control group ( $p = 0.01$ )
    - CT learners and the Control group ( $p = 0.59$ ).
    - CTE learners and CT learners ( $p = 0.028$ )

## Study 2

**RQ3:** What is the impact of hints on learners' *Hints Request Rate*, and *Follow rate* in Task 1?

## Study 2

**RQ3:** What is the impact of hints on learners' *Hints Request Rate*, and *Follow rate* in Task 1?

**1. Hints Request Rate:** *Average number of hints requested by each learner.*

1. *CT requested significantly more hints than CTE.*

	CT	CTE
Median	6	4
P-value	0.003	

**2. Hints Follow Rate:** *The average number of requested hints that have been followed by each learner.*

1. *CTE followed significantly more hints than CT.*

	CT	CTE
Median	0.57	0.71
P-value	0.03	

Implications and relation to prior work

# DISCUSSION

# Summary of the Results

*Code hints with or without self-explanation improve learners' immediate programming performance.*

- Alevén et al.: next-step hints' primary role is to help students when they get stuck (2016).
  - From *Study 1*, students appreciated the hints':  
*"it just puts me in the right direction". [P2]*
  - From *Study 2*:
    - Learners in both **CT** and **CTE** conditions completed significantly more objectives than the control group.

## *Code hints only improved learning when accompanied by self-explanation prompts.*

- Rivers' evaluation of next-step hints did not find a learning effect (2017).
- In the KLI framework, Koedinger et al., argued that “sense making” is necessary for learning from hints (2012).
- From *Study 1*, 70% of participants appreciated self-explanation prompts “*[it helps] to interpret what... the picture [hint] mean[s]*” [P2].
- From *Study 2*:
  - *CT* learners ***performed no better*** than the control condition.
  - *CTE* learners ***performed significantly better***, only ***on isomorphic objectives*** with Task 1.

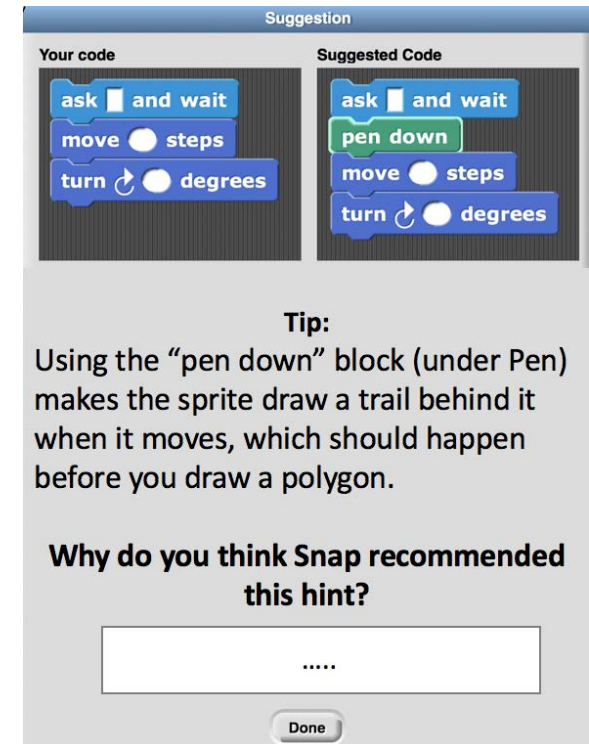

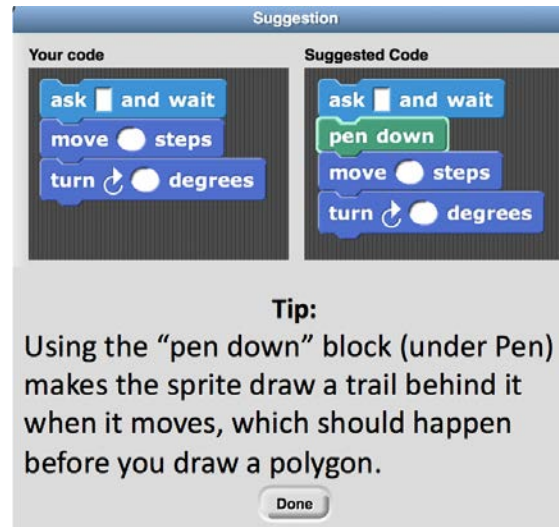

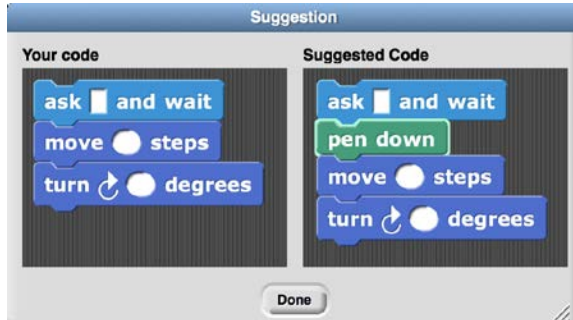

## *Self-explanation prompts changed the way that students interacted with code hints.*

- Vieira et al., argue that adding self-explanation to worked examples increased students' engagement and awareness of the worked-example (2017).
  - From *study 1*, most participants noted that self-explanation prompts caused them to:
    - “*think and take a step back about the whole process*” [P6].
  - From *study 2*:
    - Learners in the **CTE** condition:
      - Spent *more time viewing each hint* than CT learners, *requested fewer hints*, but were *more likely to follow them*.

# CONCLUSION & FUTURE WORK

# Conclusion

Code hints can improve performance and learning,  
*but depending on how we present them.*

# Future Work

- Investigate whether our results would generalize to a classroom context with more complicated programming tasks.
- Explore other forms of hints on students' behavior. (e.g. positive feedback).
- How textual explanations can be reused across several programming exercises.

# Thank You!!
